

Different finite objectives select different evidence

22 world classes; 3 collected interactions; all depth-4 targets audited.

Both native objectives select policies using only depth-3 targets.

- World information
- World-posterior Brier
- ▲ Categorical pseudo-count
- × Uniform actions
- ◆ Native mean (128 targets)
- ◆ Native maximum (128 targets)
- 5%-Brier control (b,c)

Control in (b): minimize M_3 with a 5%-Brier return allowance.

Mean: 16 wins / 6 losses. Maximum: 18 wins / 1 tie / 2 losses / 1 mixed.

Post-design; saved-policy envelopes and numerical bounds, not all-optima intervals.
